

7.1.4 F

Conservation plan for water saving around the campus

- The institute has established a water conservation system in the campus.
- The primary sources of water consumption on campus are drinking water and toilets. However, the college has developed a straightforward yet effective strategy to reduce overall water usage.
- To conserve water for landscaping, the college irrigates the lawn and garden during the early morning or late evening, minimizing evaporation caused by the sun's heat.
- The college conducts regular leak checks and addresses them promptly. Repairing leaky faucets and toilets is one of the most effective ways to prevent water waste.
- Water-saving devices have been installed throughout the campus, including replacing out dated and leaking taps, toilets, and bubblers with more efficient, water-conserving models.
- These initiatives reflect the institute's on-going commitment to water conservation and sustainability.
